One can only wonder with all the events going on in this world and country how something as simple as allowing local content to be streamed to me via my satellite radio. I have been driving truck over the road for over 8 years, and this device of technology gives me something I never had..information on whats ahead before I get there.. allowing me to plan my trip and route prior to trouble. This not only helps me make better time but lowers traffic congestion for those in the effected area. This is the information age as its called, and getting satellite radio is a means of getting needed information. Hopefully you (members of the FCC board) can understand that this dose more good than harm. If local broadcasters have a problem, its getting the information out to those that need it. Many like myself pay to get this seeing the free commercial advertising side cannot achive this. Keep in mind the majority of users of things like XM radio are hard working drivers like myself and to us this is a tool which provides entertainment and information in a timely manner. On the road in a vehichle you cant (SHOULDN'T) be trying to use a TV. Radio is our TV out here, and things like XM are our version of someone elses Cable/satellite TV. My cable TV at home brings me news and entertainment from around the globe and locally, why shouldnt my satellite enabled radio do the same?
Thankyou- Edward Bohac
